Classical mechanics describes the motion of macroscopic objects, from projectiles to parts of machinery, and astronomical objects, such as spacecraft, planets, stars and galaxies.. If the present state of an object is known it is possible to predict by the laws of classical mechanics how it will move in the future (determinism) and how it has moved in the past (reversibility).

Newton's laws of motion are three physical laws that, together, laid the foundation for classical mechanics. They describe the relationship between a body and the forces acting upon it, and its motion in response to those forces. More precisely, the first law defines the force qualitatively, the second law offers a quantitative measure of the force, and the third asserts that a single isolated ...

The simple pendulum neglects contributions from the mass of the connecting rod, friction at the pivot point, and air resistance. Note that above small angles, the pendulum is not harmonic, and the first two anharmonic components are calculated here, making the result accurate to within 1% for angles of up to 30 degrees.

The second law provides the definition of a force  $\hat{e}$  if a mass  $m$  has acceleration  $a$ , the force  $F$  acting on it is  $Fa=m$  Of course, there is a big problem with Newton's laws  $\hat{e}$  what do we take as a fixed point (and orientation)
